## **Master Robotics**

Faculty Applied Natural Sciences and Industrial Engineering  
Examination regulations 17.03.2025  
Date: 28.04.2025 09:47

## Table of Contents

- MRO-01 Robot Dynamics
- MRO-02 Advanced Methods in Control Engineering
- MRO-03 Statistics and Machine Learning for Computer Vision
- MRO-04 Technical Project Management
- MRO-05 Embedded Systems
- MRO-06 Cross-Cultural Development for Engineers
- MRO-07 Advanced Methods in Robotics
- MRO-08 Image Processing and Computer Vision
- MRO-09 Robot Modeling and Simulation
- MRO-10 Industrial Robotics and Automation
- MRO-11 Case Study ROS Robot Programming
- MRO-12 Intelligent Multi-Agent Systems
- MRO-13 Soft Robotics
- MRO-14 Sensor Fusion and Perception for Assistive Robotics
- MRO-15 Biomechanics
- MRO-16 Rehabilitation Robotics
- MRO-17 Case Study Assistive Robotics for Improvement of Life Quality
- MRO-18 Human-Robot Interaction
- MRO-19 Subject-Related Elective Course (FWP)
- MRO-20 Master Module

## MRO-01 Robot Dynamics

Module code	MRO-01
Module coordination	Prof. Dr. Dmitrii Dobriborsci
Course number and name	MRO1101 Robot Dynamics
Lecturer	Dr. Roman Zashchitin
Semester	1
Duration of the module	1 semester
Module frequency	each semester
Course type	required course
Level	postgraduate
Semester periods per week (SWS)	4
ECTS	5
Workload	Time of attendance: 60 hours self-study: 90 hours Total: 150 hours
Type of Examination	written ex. 90 min.
Duration of Examination	90 min.
Weighting of the grade	5 out of 90 ECTS
Language of Instruction	English

### Module Objective

Robot Dynamics is an advanced course that delves into the mathematical and mechanical foundations governing the movement and control of robotic systems. This course provides students with a comprehensive understanding of the principles, equations, and methodologies used in modeling and controlling the dynamic behavior of robots. It covers both theoretical aspects and practical applications, with a focus on rigid body dynamics and motion control. The Robot Dynamics course is designed to provide students with a deep understanding of the principles and concepts related to the dynamics of robotic systems. This advanced-level course covers both theoretical foundations and practical applications in the field of robot dynamics. Students will explore the mathematical modeling of robot motion, the analysis of forces and torques, and the control of robotic

movement. The course focuses on rigid body dynamics, which are fundamental for various applications, including industrial automation, aerospace, medical robotics, and autonomous systems.

Upon completion of this module, the student has achieved the following learning objectives:

**Professional competence:**

- Develop a strong comprehension of the core principles and theoretical foundations governing the dynamics of robotic systems.
- Apply mathematical modeling techniques to accurately describe the dynamic behavior of robot manipulators, taking into account factors such as mass distribution, inertia, and external forces. o Formulate dynamic equations of motion for robotic systems using advanced methods, including Lagrange's equations, to understand how forces and torques affect robot movement.
- Ensure the safety and reliability of robotic systems.

**Methodological competence:**

- Students will be able to translate real-world robot dynamics into mathematical equations and analyze them methodically.
- Competence in interpreting data and drawing meaningful conclusions from experimental results is developed.
- Design various control strategies, such as PID control, robust control, and feedback linearization. These competences are vital for effectively governing robot motion and improving control performance.

**Personal competence:**

- Personal competences such as adaptability and flexibility will be nurtured as students learn to adjust to changing circumstances and technological advancements in the field of robotics.
- Students will cultivate a personal problem-solving mindset, which is important for addressing challenges in complex robotic systems.

**Social competence:**

- Collaboratively solving complex problems related to robot dynamics is a social competence that involves brainstorming, sharing ideas, and building consensus on solutions.

## Applicability in this and other Programs

The module provides the necessary theoretical knowledge and transfer possibility for the application of robot dynamics in dynamic action and applications, specifically in AI based control. Interfaces to mechatronics, electrical engineering and computer engineering.

## Entrance Requirements

Bachelor degree in mechatronics or a closely related field.

## Learning Content

This module elaborates on the fundamental Artificial Intelligence (AI) concepts and establishes the correlation to intelligent sensor/actuator systems.

- Kinematics o Rigid body dynamics.
- Robot dynamics modelling
- Control of Robot Dynamics
- Trajectory planning and path generation
- Dynamics simulation and Software tools
- Force control o Vision servoing
- Grasping and manipulation
- Wheeled mobile robots
- Redundant Robots and Singularities
- Dynamics in Non-Cartesian Coordinates
- Advanced control strategies (e.g. Model Predictive Control)

## Teaching Methods

- Seminar-like teaching with joint exercises as well as presentations to deepen the knowledge achieved through application
- i-Learn (online learning platform)

## Recommended Literature

- [1]. "Robot Modeling and Control" by Mark W. Spong, Seth Hutchinson, and M. Vidyasagar.
- [2]. "Modern Robotics: Mechanics, Planning, and Control" by Kevin M. Lynch and Frank C. Park.

## MRO-02 Advanced Methods in Control Engineering

Module code	MRO-02
Module coordination	Prof. Dr. Dmitrii Dobriborsci
Course number and name	MRO1102 Advanced Methods in Control Engineering
Lecturer	Prof. Dr. Dmitrii Dobriborsci
Semester	1
Duration of the module	1 semester
Module frequency	each semester
Course type	required course
Level	postgraduate
Semester periods per week (SWS)	4
ECTS	5
Workload	Time of attendance: 60 hours self-study: 90 hours Total: 150 hours
Type of Examination	written ex. 90 min.
Duration of Examination	90 min.
Weighting of the grade	5 out of 90 ECTS
Language of Instruction	English

### Module Objective

Advanced control engineering is a specialized field within the broader discipline of control engineering that focuses on the development and application of sophisticated control techniques for complex systems. In advanced control engineering, engineers and researchers work on designing control systems that go beyond basic proportional-integral-derivative (PID) control. These systems are capable of handling intricate, nonlinear, time-varying, and uncertain processes, often involving high-performance, precision, and safety requirements. An Advanced Methods in Control Engineering course delves into modern techniques and tools used in the design and analysis of control systems. It focuses on advanced control theories, algorithms, and methodologies that enable engineers to tackle

complex control problems and achieve superior performance. This course provides a structured path through advanced control engineering concepts and practical applications. The course includes a combination of theoretical lectures, hands-on exercises and case studies to ensure that students gain a strong foundation in advanced control theory and its real-world applications.

Upon completion of this module, the student has achieved the following learning objectives:

**Professional competences:**

- Deep understanding of advanced control methods, enabling them to design complex control systems for a wide range of applications.
- Applying optimization techniques to control systems, resulting in improved performance and efficiency.
- Proficiency in controlling nonlinear systems, which are common in real-world applications, leading to more versatile control strategies.
- The capability to develop adaptive control systems that can self-adjust to changing system conditions and parameters.
- Design control systems that are robust to uncertainties and external disturbances, enhancing system reliability.

**Methodological competence:**

- ability to create accurate mathematical models of dynamic systems, which is crucial for control system design.
- skill to conduct both simulations and real-world experiments to validate control system designs.
- Improved analytical and problem-solving skills for addressing complex control challenges.
- The ability to conduct literature reviews to stay updated with the latest research and emerging trends in control engineering.
- Competence in using advanced control software and simulation tools to model, analyze, and optimize control systems.

**Personal competence:**

- manage complex control system projects, from inception to implementation, including time management and resource allocation.
- Improved ability to communicate complex control concepts and designs effectively with both technical and non-technical stakeholders.
- Encouragement to think creatively and innovatively when designing control systems for various applications.

**Social competence:**

- Proficiency in building professional networks with peers, mentors, and industry professionals to stay informed about current trends and to explore career opportunities.

## Applicability in this and other Programs

The module provides the necessary theoretical knowledge and transfer possibility for the application of advanced control engineering methods in various application scenarios. It creates interfaces to courses of study such as mechatronics, computer science, robotics, automation.

## Entrance Requirements

Bachelor degree in mechatronics or a closely related field.

## Learning Content

"Advanced Methods in Control Engineering" course covers advanced control theory, techniques, and applications. This type of course is typically offered at the postgraduate level and assumes a foundational understanding of control engineering concepts. Topics in this course are:

- Introduction to Advanced Control.
- State-Space Representation.
- Optimal Control.
- Robust Control.
- Nonlinear Control.
- Adaptive Control.

Furthermore, this course covers system identification in the control applications (e.g. under disturbances):

- least square method.
- Kalman filtering.
- disturbance estimation and cancellation.

Also, this course considers discrete time control.

- Transitioning from continuous-time to discrete-time control.
- Discrete-time state-space representation.
- Discretization of continuous-time controllers.

This course concludes with NN (neural network)-based control methods:

- Neural Network-Based Control Concepts..
- Recurrent Neural Networks in Control
- Reinforcement learning.

## Teaching Methods

- Seminar-like teaching with joint exercises as well as presentations to deepen the knowledge achieved through application.

- i-Learn (online learning platform).

## **Recommended Literature**

- [1]. "Nonlinear Systems" by Hassan K. Khalil
- [2]. "Model Predictive Control: Theory and Design" by James B. Rawlings and David Q. 9 Mayne
- [3]. "Optimal Control Theory: An Introduction" by Donald E. Kirk
- [4]. "Neural Network Control of Nonlinear Discrete-Time Systems" by K. S. Narendra and Anudeepthi V. Kadali

## MRO-03 Statistics and Machine Learning for Computer Vision

Module code	MRO-03
Module coordination	Prof. Dr. Tobias Schaffer
Course number and name	MRO1103 Statistics and Machine Learning for Computer Vision
Lecturer	Prof. Dr. Tobias Schaffer
Semester	1
Duration of the module	1 semester
Module frequency	each semester
Course type	required course
Level	postgraduate
Semester periods per week (SWS)	4
ECTS	5
Workload	Time of attendance: 60 hours self-study: 90 hours Total: 150 hours
Type of Examination	written ex. 90 min.
Duration of Examination	90 min.
Weighting of the grade	5 out of 90 ECTS
Language of Instruction	English

### Module Objective

"Statistics and Machine Learning" course is typically designed to teach students the principles, methods, and techniques of both statistics and machine learning, and how these disciplines are used to analyze data and make predictions. The course covers a wide range of topics related to data analysis, modeling, and predictive analytics. Upon completion of this course, the student has achieved the following learning objectives:

#### Professional competence:

- Students will become proficient in data analysis, including data cleaning, preprocessing, and deriving meaningful insights from data.
- Competence in building predictive models for both regression and classification tasks, as well as time series forecasting.
- The ability to implement machine learning algorithms and deep learning models using popular libraries like scikit-learn, TensorFlow, and PyTorch.
- Understanding how to draw conclusions from data, perform hypothesis testing, and estimate population parameters.
- Proficiency in evaluating the performance of machine learning models using appropriate metrics and cross-validation techniques.
- Skill in creating informative and visually appealing data visualizations to present findings effectively.

**Methodological competence:**

- The capability to define research problems, formulate hypotheses, and devise data-driven solutions.
- Competence in designing experiments and data collection strategies for research or business purposes.
- To engineer new features from existing data to improve model performance.
- Understanding techniques for reducing the dimensionality of data while preserving important information.
- Competence in analyzing and modeling time series data for forecasting applications.

**Personal competence:**

- Development of critical thinking skills for assessing the validity and applicability of statistical and machine learning methods to different problems.
- The ability to adapt to evolving data analysis and machine learning techniques, tools, and frameworks.
- Fostering the capability to continue learning independently, keeping up with the latest developments in the field.
- Developing a sense of ethical responsibility in data handling and model development, including understanding issues related to bias and fairness.

**Social competence:**

- Effective communication of data analysis results, findings, and predictions to both technical and non-technical stakeholders.

**Applicability in this and other Programs**

Application of statistical and probability theory in robot perception. Course is also applicable for various AI-related master degree programs.

## Entrance Requirements

Bachelor`s degree in mechatronics or a closely related field.

## Learning Content

The course is designed to be hands-on, with practical exercises and projects where students apply statistical and machine learning techniques to analyze data and solve real-world problems. It's important for students to gain both theoretical knowledge and practical skills, as these are highly sought after in data analysis and machine learning roles in various industries, including finance, healthcare, marketing, and more. Topics in this course are:

- Introduction to Statistics and Machine Learning
- Descriptive Statistics o Probability and Probability Distributions
- Statistical Inference
- Linear Regression
- Classification Algorithms
- Bayesian Methods
- Clustering and Unsupervised Learning
- Feature Selection and Engineering
- Introduction to Machine Learning Frameworks
- Model Evaluation and Validation o Natural Language Processing (NLP)
- Anomaly Detection and Outlier Analysis
- Generative adversarial networks (GANs)
- Time Series Forecasting with Machine Learning
- Big Data and Distributed Machine Learning

## Teaching Methods

- Seminar-like teaching with joint exercises as well as presentations to deepen the knowledge achieved through application
- i-Learn (online learning platform)

## Recommended Literature

- [1]. "Introduction to the Practice of Statistics" by David S. Moore, George P. McCabe, and Bruce A. Craig.
- [2]. "Machine Learning: A Probabilistic Perspective" by Kevin P. Murphy.
- [3]. "Introduction to Machine Learning with Python: A Guide for Data Scientists" by Andreas C. Müller & Sarah Guido.
- [4]. "Deep Learning" by Ian Goodfellow, Yoshua Bengio, and Aaron Courville.

## MRO-04 Technical Project Management

Module code	MRO-04
Module coordination	Dr. Jürgen Holz
Course number and name	MRO1104 Technical Project Management
Lecturer	Dr. Jürgen Holz
Semester	1
Duration of the module	1 semester
Module frequency	each semester
Course type	required course
Level	postgraduate
Semester periods per week (SWS)	4
ECTS	5
Workload	Time of attendance: 60 hours self-study: 90 hours Total: 150 hours
Type of Examination	Portfolio
Weighting of the grade	5 out of 90 ECTS
Language of Instruction	English

### Module Objective

The Technical Project Management course is designed to equip students with the essential knowledge and skills needed to successfully plan, execute, and manage technical projects in various domains. This course integrates project management principles with a focus on technical aspects, providing students with the tools to effectively lead and execute projects that involve technology, engineering, or scientific components. Students will learn to balance technical requirements, project scope, timelines, and resource management to deliver successful outcomes. After completion of this module, the student has achieved the following learning objectives:

#### Professional competence:

- Competence in planning, executing, and overseeing complex technical projects from initiation to closure, including resource allocation and risk management.
- An understanding of the technical aspects of projects, allowing students to make informed decisions and effectively communicate with technical experts.
- Competence in ensuring that project deliverables meet defined quality standards and that quality control measures are effectively implemented.
  - o Ability to handle changes in project scope and requirements effectively, making adjustments while minimizing disruptions to project progress.
- Understanding of agile methodologies and their application in technical projects, promoting adaptability and flexibility

**Methodological competence:**

- Competence in defining project objectives, scope, and requirements, creating project plans, and managing the project schedule and budget.
- Ability to identify, assess, and mitigate project risks, as well as develop contingency plans to minimize the impact of unexpected events.
- Competence in identifying and analyzing stakeholders, understanding their needs, and effectively communicating with project teams and stakeholders.
- Ability to evaluate and select vendors, manage contracts, and ensure vendor performance aligns with project goals.
- Proficiency in maintaining comprehensive project documentation, providing transparent reporting to stakeholders, and conducting project closure activities.

**Personal competence:**

- Development of critical thinking skills for assessing project challenges, making informed decisions, and solving complex technical problems.
- The ability to adapt to evolving project requirements, methodologies, and changing project conditions.
- Understanding and applying ethical principles in project management, particularly concerning data privacy, diversity, and inclusion.
- Improved time management skills to meet project deadlines and manage competing priorities effectively.

**Social competence:**

- Building relationships with industry peers and experts, creating opportunities for professional growth and knowledge exchange.
- The skill to assess project outcomes, identify areas for improvement, and implement continuous improvement strategies in future projects.

## Applicability in this and other Programs

The module provides the necessary theoretical background and transfer possibility for the technical project management and team cooperation. Interfaces to any technically related programmes.

## Entrance Requirements

Bachelor degree in mechatronics or a closely related field.

## Learning Content

This extended Technical Project Management course offers students an opportunity to thoroughly understand and apply project management principles within a technical context. It places a strong emphasis on hands-on learning, real-world case studies, and practical application, ensuring that students are well-prepared to lead and manage complex technical projects effectively. In addition, the following topics are also covered in this module:

- Project Initiation and Stakeholder Analysis.
- Project Planning and Work Breakdown Structure (WBS).
- Resource Allocation and Scheduling.
- Risk Management in Technical Projects.
- Technical Requirements and Scope Management.
- Agile Project Management in Technical Projects.
- Quality Management in Technical Projects.
- Project Documentation, Reporting, and Closure.

## Teaching Methods

- Seminar-like teaching with joint exercises as well as presentations to deepen the knowledge achieved through application.
- i-Learn (online learning platform).

## Recommended Literature

## MRO-05 Embedded Systems

Module code	MRO-05
Module coordination	Prof. Dr. Tobias Schaffer
Course number and name	MRO1105 Embedded Systems
Lecturer	Prof. Dr. Tobias Schaffer
Semester	1
Duration of the module	1 semester
Module frequency	each semester
Course type	required course
Level	postgraduate
Semester periods per week (SWS)	4
ECTS	5
Workload	Time of attendance: 60 hours self-study: 90 hours Total: 150 hours
Type of Examination	written ex. 90 min.
Duration of Examination	90 min.
Weighting of the grade	5 out of 90 ECTS
Language of Instruction	English

### Module Objective

An Embedded Systems course focuses on the integration of control theory with embedded systems, which are computer systems designed to perform dedicated functions within a larger mechanical or electrical system. This course emphasizes the design, implementation, and analysis of control systems that are embedded within real-world applications. Upon completion of this module, depending on a more theoretical or more practical focus, students will be able to design embedded robotic solutions including, microcontroller programming, learn common embedded systems peripherals like GPIO (General Purpose Input/Output) pins, digital and analog sensors, and actuators. This course emphasizes real-time implementation of algorithms, which is crucial for robotic systems as they act in the dynamic environments.

### **Professional competence:**

- Developing a high level of expertise in embedded systems, microcontroller programming, and related technologies.
- Proficiency in designing and architecting embedded systems to meet specific requirements and constraints.
- Competence in programming embedded systems using C/C++ and understanding the intricacies of low-level code.
- Proficient at integrating software and hardware components for embedded systems.
- Understanding and applying real-time concepts in embedded system design, ensuring timely responses to events.

### **Methodological competence:**

- Developing the ability to identify and troubleshoot issues in embedded systems and propose effective solutions.
- Competency in working with Real-Time Operating Systems (RTOS) for multitasking and resource management.
- Methodical approach to testing and debugging embedded systems to ensure reliability and correctness. o Skill in documenting the design, development, and testing processes effectively.
- Competence in planning and organizing embedded system projects, including resource allocation and time management.

### **Personal competence:**

- Demonstrating flexibility in learning and adapting to new technologies and hardware platforms.
- Maintaining a high level of motivation and curiosity to explore and understand embedded systems concepts.
- Managing challenges and setbacks effectively, maintaining composure in complex problem-solving scenarios.

### **Social competence:**

- Effectively conveying technical information and ideas to peers and team members.
- Working collaboratively with team members, respecting diverse perspectives, and achieving shared project goals.
- Skill in addressing and resolving conflicts within project teams, fostering a positive working environment.

## **Applicability in this and other Programs**

The module provides the necessary theoretical knowledge and the transfer capability to gain a deeper understanding of embedded solutions and the capability to apply and

to evaluate hardware in and for a specific area of application. This creates interfaces to courses of study such as mechanical engineering, mechatronics, electrical engineering.

## Entrance Requirements

Bachelor degree in mechatronics or a closely related field.

## Learning Content

On the basis of a selected application example, the students should explore and work on the topic themselves by means of literature research, independent sub-tasks, etc. The topics of the case studies can be chosen from any subject area.

Topics:

- Introduction to Embedded Systems
- Microcontrollers and Microprocessors
- Embedded C Programming
- Embedded System Peripherals
- Real-Time Operating Systems (RTOS)
- Embedded System Development Tools
- Embedded System Design

## Teaching Methods

- Seminar-like teaching with joint exercises as well as presentations to deepen the knowledge achieved through application.
- i-Learn (online learning platform).

## Recommended Literature

- [1]. "Embedded Systems: Introduction to ARM Cortex-M Microcontrollers" by Jonathan Valvano
- [2]. "Embedded Systems: Real-Time Operating Systems for ARM Cortex-M Microcontrollers" by Jonathan Valvano
- [3]. "Programming Embedded Systems in C and C++" by Michael Barr
- [4]. "Real-Time Systems Design and Analysis" by Phillip A. Laplante

## MRO-06 Cross-Cultural Development for Engineers

Module code	MRO-06
Module coordination	Stefanie Dierlmeier
Course number and name	MRO1106 Cross-Cultural Development for Engineers
Lecturers	Stefanie Dierlmeier Melanie Wittmann
Semester	1
Duration of the module	1 semester
Module frequency	each semester
Course type	required course
Level	postgraduate
Semester periods per week (SWS)	4
ECTS	5
Workload	Time of attendance: 60 hours self-study: 90 hours Total: 150 hours
Type of Examination	Portfolio
Weighting of the grade	5 out of 90 ECTS
Language of Instruction	English

### Module Objective

This module is to prepare engineering students for navigating the dynamics of a collaborative working environment and settling down in the target employment region Germany. This course takes into account intercultural and soft skills at professional level to integrate well into multi-cultural work settings.

Upon completion of this module, students will have achieved the following learning outcomes:

#### Professional competence:

- Students will be trained to deal with cultural norms and regulations adequately.

- Concepting, implementing and reflecting upon the culture-specific project presentations allows students to actively apply their cultural knowledge gained onto their native countries and thus strengthen their critical thinking skills by putting different cultural aspects in contrast to one another.
- They will be coached how to conduct presentations to lay the groundwork for later presentations frequently expected to deliver as engineers.

#### **Methodological competence:**

- The cohort is expected to acquire an understanding of the target matrix and methodology related to intercultural communication.
- They are sensibilized on dealing professionally with stereotypes and prejudices by reflecting on their own culture and the target culture Germany in depth.
- Students learn to develop strategies to analyze cultures, e.g. main target culture Germany, by applying the theoretical knowledge obtained onto various practical work-environment simulations in class.
- They will be enabled to identify common personality types, including their own, within the working world based on the four-colour personality theory by Thomas Erikson and guided to develop their own handling strategies.

#### **Personal competence:**

- Students will be encouraged to develop a cosmopolitan mindset towards intercultural situations.
- The cohort will strengthen their awareness of problems common to arise within intercultural contexts and learn to develop coping strategies to overcome emerging communication barriers.

#### **Social competence:**

- Students intensify and refine their individual observation and reflection skills against an intercultural backdrop.
- Multi-cultural teamwork skills as well as communication are fostered through the collaboration on role plays and simulation exercises.

### **Applicability in this and other Programs**

Theoretical and practical approaches taught in this course can be transferred onto the German language classes and Career Service seminars, for instance.

### **Entrance Requirements**

Bachelor's degree in mechatronics, production engineering, industrial engineering or a closely related field.

## Learning Content

The module shall impart knowledge and practical approaches to overcome communication challenges frequently arising in multi-cultural work settings. A core part of this module is to establish a practical relation from students native source culture to the German target culture to prepare them for the requirements and challenges they are likely to handle if their future career is pursued within Germany. Furthermore, essential soft skills for engineers, such as dealing with various personality types at the workplace, problem-solving skills or organizational skills, are paramount to this course. Following this module, students have recognized their individual actions continuously being affected by culture-specific values and norms. Furthermore, theoretic and practical expertise in the field of intercultural communication is to be provided. The latter is particularly enhanced by the student cohort deriving from different nationalities throughout the globe.

### Pillar I: Global collaboration

Engineers often work in international teams or with global clients, which renders global collaboration skills decisive in todays interconnected world. Sample topics include:

- cultural competencies (understanding cultural differences, effective communication techniques, verbal and non-verbal clues, body language, cultural sensitivity)
- communication skills (clear and concise writing for emails, reports etc., language skills, team dynamics)
- global ethics & compliance
- fostering innovation & creativity

### Pillar II: Personal development

Personal and interpersonal skills complement the technical knowledge of students and are thus essential for effective communication, collaboration, problem-solving, and adaptability in a global context. Sample topics include:

- organisational skills (e.g. time management, planning, prioritisation)
- problem-solving skills (e.g. brainstorming, innovation, critical thinking, researching, summarising knowledge)
- conducting a presentation
- interpersonal skills (e.g. active listening, social perceptiveness, handling feedback, recognising and dealing with different personality types at the workplace, based on the scientific four-colour-personality theory)
- ethical and professional conduct
- emotional intelligence (self-awareness and regulation, motivation and resilience)

### Pillar III: Cultural studies of target country Germany

For international students planning to study in Germany, understanding certain cultural, social, and practical aspects of the country is crucial for a smooth transition and enriching experience. Sample topics include:

- social/cultural norms and values
- education system
- language and dialects, identifying resources for learning German
- political culture, e.g. federalism
- work regulations for students
- healthcare system
- accommodation
- workplace culture & hierarchical structures

#### Pillar IV: Career growth in Germany

Career guidance and German language input related to the working world is to help students navigate their professional paths effectively and ensures they can leverage their education and skills to achieve long-term success. Sample topics include:

- requirements of the German job market
- professional etiquette
- networking
- online presence
- conduct at job fairs
- how to apply
- mock job interviews

### Teaching Methods

- This module encompasses seminars, simulations, case studies and role play to promote students individual scope of action pursued in intercultural settings.
- Intercultural presentations developed by students are integral to solidify their cultural reflection skills by putting their native culture in comparison to the knowledge on German cultural studies taught within the course.
- iLearn (online learning platform)

## MRO-07 Advanced Methods in Robotics

Module code	MRO-07
Module coordination	Christy Paul
Course number and name	MRO-IR2101 Advanced Methods in Robotics
Lecturer	Christy Paul
Semester	2
Duration of the module	1 semester
Module frequency	each semester
Course type	required course
Level	postgraduate
Semester periods per week (SWS)	4
ECTS	5
Workload	Time of attendance: 60 hours self-study: 90 hours Total: 150 hours
Type of Examination	Portfolio
Weighting of the grade	5 out of 90 ECTS
Language of Instruction	English

### Module Objective

An "Advanced Methods in Robotics" course typically delves into more advanced concepts and techniques in the field of robotics, assuming a foundation in robotics fundamentals. The course covers a wide range of advanced topics in robotics, focusing on practical applications and emerging trends. It's designed to provide students with a deep understanding of advanced methods and the ability to apply them to real-world robotics problems.

Upon completion of this module, the student has achieved the following learning objectives:

#### Professional competence:

- Gain a deep understanding of advanced robotics principles, technologies, and methodologies.

- Develop skills in using advanced sensors and perception techniques, such as Lidar, depth cameras, and Visual SLAM, to enhance robotic perception.
- Master advanced motion planning and control algorithms, including reinforcement learning and real-time reactive control.
- Acquire proficiency in using machine learning for robotics applications, from supervised and unsupervised learning to reinforcement learning and transfer learning.
- Develop the ability to implement Simultaneous Localization and Mapping (SLAM) techniques for robot localization and environment mapping.

**Methodological competence:**

- Enhance problem-solving skills, particularly in addressing complex challenges in robotics and applying appropriate methodologies.
- Gain experience in experimental design, data collection, and analysis for robotics research and development.
- Acquire project management skills for planning, executing, and delivering robotics projects

**Personal competence:**

- Strengthen self-motivation for continuous learning, experimentation, and exploration of advanced robotics concepts.
- Improve adaptability in keeping pace with rapidly evolving robotics technologies and methodologies.

**Social competence:**

- Enhance the ability to work effectively in multidisciplinary teams on complex robotics projects.
- Build leadership skills and the capacity to mentor and guide peers in advanced robotics concepts and projects .

## **Applicability in this and other Programs**

The module provides the necessary theoretical knowledge and transfer possibility for the application of autonomous robotics and algorithms for autonomous systems in different systems and applications. Interfaces to mechatronics, electrical engineering and computer engineering.

## **Entrance Requirements**

Bachelor degree in mechatronics or a closely related field.

## Learning Content

The "Advanced methods in robotics" course is designed to provide students with an in-depth exploration of advanced concepts, methodologies, and technologies in the field of robotics. Building upon fundamental robotics knowledge, this course delves into cutting-edge advancements, including advanced sensors, perception, planning and control, machine learning for robotics, human-robot interaction, and practical applications in various domains. Through a combination of theoretical learning, hands-on projects, and research opportunities, students will develop the skills and expertise required to tackle complex robotics challenges and contribute to the advancement of the field. This results in several relevant subject areas, such as:

- Advanced Sensors and Perception
- Robot Planning and Control
- Soft robotics
- Simultaneous Localization and Mapping
- Machine Learning for Robotics
- Autonomous self-driving vehicles
- Swarm robotics

Furthermore, this module addresses the application of autonomous systems relevant to the industry and delves further into the content of mobile and collaborative robotics.

Relevant subject areas:

- Advanced manipulation and grasping
- Human-Robot Interaction

## Teaching Methods

- Seminar-like teaching with joint exercises as well as presentations to deepen the knowledge achieved through application
- i-Learn (online learning platform)

Workload	Time of attendance: 60 hours self-study: 90 hours Total: 150 hours
Type of Examination	Portfolio
Weighting of the grade	5 out of 90 ECTS
Language of Instruction	English

### Module Objective

The "Image Processing and Computer Vision" course provides students with a comprehensive understanding of the principles, algorithms, and applications of image processing and computer vision. Students will learn to manipulate, enhance, and analyze digital images and develop the skills to build computer vision systems. The course covers both theoretical foundations and practical applications, enabling students to apply image processing and computer vision techniques to real-world problems. By the end of the "Image Processing and Computer Vision" course, students will have developed a comprehensive skill set that includes advanced technology expertise, strong problem-solving abilities, and effective interpersonal and communication skills. These competences

will prepare them for careers in fields such as image analysis, computer vision, machine learning, and artificial intelligence.

Upon completion of this module, the student has achieved the following learning objectives:

**Professional competence:**

- Develop a deep understanding of image processing techniques, including filtering, enhancement, and segmentation.
- Gain skills in computer vision, covering object optical flow, and 3D reconstruction.
- Acquire knowledge of deep learning models, especially convolutional neural networks (CNNs), for image classification, object detection, and semantic segmentation.
- Apply image processing and computer vision techniques to solve real-world problems, such as object detection, tracking, and augmented reality.
- Explore emerging trends in computer vision, enabling students to stay current with the latest advancements and contribute to the field.

**Methodological competence:**

- Develop skills in designing experiments and evaluating the performance of image processing and computer vision algorithms.
- Acquire project management skills, from conceptualization and design to implementation and testing of computer vision applications.
- Enhance problem-solving skills, particularly in diagnosing and addressing issues in image analysis and computer vision.
- Understand the importance of simulation and testing in the development and validation of computer vision systems.

**Personal competence:**

- Foster critical thinking and analytical skills to evaluate and improve image processing and computer vision solutions.
- Cultivate innovation and creativity in designing novel computer vision applications and addressing complex challenges.
- Improve adaptability to keep up with rapidly evolving technologies and methodologies in image processing and computer vision.

**Social competence:**

- Enhance the ability to work effectively in multidisciplinary teams on complex computer vision projects .
- Develop conflict resolution skills, especially in situations with differing project goals and opinions within the team .
- Improve the ability to communicate complex technical ideas to both technical and non-technical stakeholders .

## Applicability in this and other Programs

The module provides the necessary theoretical knowledge and transfer possibility for the application of computer vision systems in different systems and applications. Interfaces to mechatronics, electrical engineering and computer engineering.

## Entrance Requirements

Bachelor degree in mechatronics or a closely related field.

## Learning Content

Image processing and computer vision are two closely related fields in computer science and engineering that deal with the analysis, understanding, and manipulation of visual information from images and videos.

### Topics:

- Introduction to Image Processing
- Image Filtering and Enhancement
- Image Segmentation and Object Recognition
- Feature Extraction and Descriptors
- Computer Vision Fundamentals
- Deep Learning for Computer Vision
- Image-based rendering and augmented reality.
- Visual SLAM (Simultaneous Localization and Mapping).

## Teaching Methods

- Seminar-like teaching with joint exercises as well as presentations to deepen the knowledge achieved through application.
- i-Learn (online learning platform).

## Recommended Literature

- [1]. "Digital Image Processing" by Rafael C. Gonzalez and Richard E. Woods
- [2]. "Computer Vision: Algorithms and Applications" by Richard Szeliski
- [3]. "Deep Learning" by Ian Goodfellow, Yoshua Bengio, and Aaron Courville
- [4]. "Hands-On Machine Learning with Scikit-Learn, Keras, and TensorFlow" by Aurélien Géron
- [5]. "Learning OpenCV 4 Computer Vision with Python" by Joseph Howse, Prateek Joshi, and Vishwesh Ravi Shrimali

## MRO-09 Robot Modeling and Simulation

Module code	MRO-09
Module coordination	Christy Paul
Course number and name	MRO-IR2103 Robot Modeling and Simulation
Lecturer	Christy Paul
Semester	2
Duration of the module	1 semester
Module frequency	each semester
Course type	required course
Level	postgraduate
Semester periods per week (SWS)	4
ECTS	5
Workload	Time of attendance: 60 hours self-study: 90 hours Total: 150 hours
Type of Examination	Portfolio
Weighting of the grade	5 out of 90 ECTS
Language of Instruction	English

### Module Objective

The "Robot Modeling and Simulation" course focuses on advanced software aspects of robot modeling and simulation. This course explores advanced software tools, libraries, and platforms used for modeling and simulating robotic systems, with a particular focus on software aspects. Students will delve into topics such as dynamics, sensor simulation, control algorithms, high-level simulation environments, multibody dynamics, soft robots, parallel and redundant manipulators, hybrid systems, advanced sensor simulation, and virtual reality (VR) applications in robotics simulation. The course includes research or project work that emphasizes advanced software applications in robot simulation.

Upon completion of this module, the student has achieved the following learning objectives:

#### Professional competence:

- Develop an advanced level of proficiency in using software tools, libraries, and platforms for robot modeling and simulation .
- Gain expertise in modeling multibody dynamics and constraint-based modeling, enabling accurate simulation of complex robotic systems.
- Specialized knowledge and skills in simulating soft robots and deformable bodies, which are increasingly important in robotics applications.
- Master the simulation of complex robot manipulators, including parallel and redundant systems, and apply advanced control algorithms.
- Develop the ability to model and simulate hybrid systems and engage in co-simulation of diverse subsystems within robotics applications.

**Methodological competence:**

- Develop advanced skills in designing and analyzing complex robotic simulations, including performance evaluation and optimization.
- Learn advanced methods for experimentation and testing in simulated environments, with a focus on real-time control and performance assessment.
- Enhance problem-solving skills, particularly when addressing challenges related to multibody dynamics, soft robotics, and parallel manipulators.

**Personal competence :**

- Cultivate advanced critical thinking and creative problem-solving skills when faced with complex issues in robot modeling and simulation.
- Develop the ability to adapt to rapidly evolving software and technology, staying current with the latest advancements in robotics simulation.
- Strengthen self-motivation and initiative, especially when undertaking advanced research or project work in a specialized area.

**Social competence:**

- Collaboration skills when working with multidisciplinary teams on complex robotics projects, leveraging advanced software applications .
- Improve advanced communication skills to convey complex technical ideas to both technical and non-technical stakeholders .
- Build leadership skills and the capacity to mentor and guide peers in advanced software applications within the context of robotics simulation .

## **Applicability in this and other Programs**

The module provides the necessary theoretical knowledge and transfer possibility for the application of tools and instrumentation for robot modeling and simulation. Interfaces to mechatronics, electrical engineering and computer engineering.

## Entrance Requirements

Bachelor degree in mechatronics or a closely related field.

## Learning Content

By the end of the course, students will have developed a comprehensive skill set that includes advanced software proficiency, in-depth knowledge of advanced topics in robotics simulation, and the ability to engage in cutting-edge research or advanced projects in the field. These competences prepare them for roles in software development, research, and innovation within the domain of robot modeling and simulation.

### Topics:

- Advanced Robot Kinematics and Dynamics with Software.
- High-Level Simulation Platforms and Software.
- Advanced Software for Robot Simulation.
- Virtual Reality (VR) and Robotics Simulation.
- Advanced Sensing and Perception.
- Advanced Sensor Simulation.
- Software-based optimization for motion planning and control.
- Advanced Robot Manipulation and Grasping Software.

## Teaching Methods

- Seminar-like teaching with joint exercises as well as presentations to deepen the knowledge achieved through application
- i-Learn (online learning platform)

## Recommended Literature

- [1]. "Parallel Robots" by J. M. Herve
- [2]. "Modeling and Control of Robot Manipulators" by Lorenzo Sciavicco and Bruno Siciliano
- [3]. "Hybrid Systems: Computation and Control" by Rajeev Alur and George J. Pappas

## MRO-10 Industrial Robotics and Automation

Module code	MRO-10
Module coordination	Prof. Dr. Dmitrii Dobriborsci
Course number and name	MRO-IR2104 Industrial Robotics and Automation
Lecturer	Prof. Dr. Dmitrii Dobriborsci
Semester	2
Duration of the module	1 semester
Module frequency	each semester
Course type	required course
Level	postgraduate
Semester periods per week (SWS)	4
ECTS	5
Workload	Time of attendance: 60 hours self-study: 90 hours Total: 150 hours
Type of Examination	written ex. 90 min.
Duration of Examination	90 min.
Weighting of the grade	5 out of 90 ECTS
Language of Instruction	English

### Module Objective

The "Industrial Robotics and Automation" course provides an in-depth exploration of the principles, technologies, and applications of industrial automation and robotics systems. Students will learn about the design, programming, and operation of industrial robots, as well as the integration of automation solutions in manufacturing and industrial processes. Upon completion of this module, the student has achieved the following learning objectives:

- Develop a strong understanding of industrial robotics and automation systems.
- Gain proficiency in the operation and programming of industrial robots.
- Learn about automation technologies, including PLCs and SCADA systems.

- Apply knowledge to the design and optimization of automated manufacturing processes.

#### **Professional competence:**

- Develop a deep understanding of industrial robotics and automation systems, including their design, operation, and applications in manufacturing.
- Gain practical skills in programming and controlling industrial robots, covering topics such as kinematics, dynamics, and vision systems.
- Acquire proficiency in Programmable Logic Controllers (PLCs) and Supervisory Control and Data Acquisition (SCADA) systems, including programming and integration.
- Learn to design and implement automation solutions for industrial processes, considering factors like safety, efficiency, and cost-effectiveness.

#### **Methodological competence:**

- Develop the ability to analyze and solve complex problems in industrial automation and robotics, both theoretically and practically.
- Gain practical experience in programming, configuring, and operating industrial robots and automation systems through labs and projects.
- Learn to design experiments and analyze data to optimize automation solutions and manufacturing processes.

#### **Personal competence:**

- Foster critical thinking skills to evaluate and improve automation and robotics solutions in a constantly evolving industry.
- Develop adaptability to keep pace with rapidly changing automation technologies and methodologies.
- Cultivate self-motivation for continuous learning and problem-solving in the field of industrial robotics and automation.

#### **Social competence:**

- Collaboration skills when working with multidisciplinary teams on complex robotics projects, leveraging advanced software applications .
- Improve advanced communication skills to convey complex technical ideas to both technical and non-technical stakeholders .
- Build leadership skills and the capacity to mentor and guide peers in advanced software applications within the context of robotics simulation .

### **Applicability in this and other Programs**

The module provides the necessary theoretical knowledge and transfer possibility for the application of automation technologies, including PLCs and SCADA systems. Interfaces to mechatronics, electrical engineering and computer engineering.

## Entrance Requirements

Bachelors degree in mechatronics or a closely related field.

## Learning Content

This "Industrial Robotics and Automation" course aims to equip students with the knowledge and skills required for careers in industrial automation, manufacturing, and robotics. It covers fundamental principles, hands-on experience, and emerging trends in the field, making it a valuable course for those looking to enter the industrial automation industry .

### Topics:

- Industrial Robot Fundamentals
- Industrial Automation Technologies
- Automation Sensors and Actuators
- Automation System Integration
- Industrial Robotics in Practice
- Industry 4.0 and smart manufacturing .

## Teaching Methods

- Seminar-like teaching with joint exercises as well as presentations to deepen the knowledge achieved through application
- i-Learn (online learning platform)

## Recommended Literature

- [1]. "Industrial Automation and Robotics: An Introduction" by A. K. Gupta
- [2]. "Industrial Robotics: Technology, Programming, and Applications" by Mikell P. Groover and Mitchell Weiss
- [3]. "Introduction to Autonomous Robots" by Nikolaus Correll, Bradley Hayes, et al. [4]. "Robot Modeling and Control" by Mark W. Spong, Seth Hutchinson, and M. Vidyasagar
- [5]. "PLC Programming Using RSLogix 5000: Basic Concepts of Ladder Logic Programming!" by Gary Dunning.

## MRO-11 Case Study ROS Robot Programming

Module code	MRO-11
Module coordination	Ruben Contreras
Course number and name	MRO-IR2105 Case Study ROS Robot Programming
Lecturer	Ruben Contreras
Semester	2
Duration of the module	1 semester
Module frequency	each semester
Course type	required course
Level	postgraduate
Semester periods per week (SWS)	4
ECTS	5
Workload	Time of attendance: 60 hours self-study: 90 hours Total: 150 hours
Type of Examination	Portfolio
Weighting of the grade	5 out of 90 ECTS
Language of Instruction	English

### Module Objective

On the basis of an application example in the case study comprehensive exploration of the Robot Operating System (ROS) and its practical application in programming and controlling robots is considered. Students will be introduced to the fundamentals of ROS, develop programming skills for robotic systems, and engage in hands-on projects that culminate in real-world robot programming applications. The course encompasses various aspects of robotics, including perception, motion planning, navigation, and manipulation.

Upon completion of this module, students will have achieved the following learning outcomes:

#### Professional competence:

- Develop expertise in using the Robot Operating System (ROS) to program, control, and navigate robots effectively. Acquire the skills to develop, maintain, and optimize software for robotic systems.
- Learn to integrate hardware and software components to build functional robot systems.
- Gain competence in developing motion planning algorithms for robots, enabling them to navigate and interact with their environment.
- Master techniques for sensor data processing, object recognition, and environment mapping.

**Methodological competence:**

- Develop the ability to identify and resolve complex issues related to robot programming and control.
- Apply scientific methodologies for robot experimentation, data collection, and analysis.
- Learn to model and simulate robots and their environments to test algorithms and strategies.
- Develop the practice of documenting project work, code, and research findings effectively.

**Personal competence:**

- Application of software development concepts based on the ROS framework for research and implementation of robot motion control algorithms in complex dynamic environments.
- The students learn different concepts which can be applied to deploy robotics-related applications.

**Social competence:**

- Develop effective communication skills to collaborate with peers and convey technical concepts to non-technical stakeholders.
- Foster teamwork and cooperation within diverse project teams, valuing diverse perspectives and contributions
- Build the capacity to resolve conflicts and disagreements constructively within the team or among project stakeholders.

**Applicability in this and other Programs**

The skills and competences acquired in a "ROS Robot Programming" course can be applied to a wide range of master's degree programs and fields, e.g. AI, Industrial engineering, etc.

**Entrance Requirements**

Bachelor degree in mechatronics or a closely related field.

## Learning Content

On the basis of a selected application example, the students should explore and work on the topic themselves by means of literature research, independent sub- tasks, etc. The topics of the case studies can be chosen from any subject area.

The topics of the case studies can vary each semester.

## Teaching Methods

- i-Learn (online learning platform).
- Literature research..
- Simulations.
- Development, construction and building of robotic systems.
- Application of assessment techniques.
- Guided work on seminar topics in working groups. Accompanying events / presentations by external speakers depending on the selected topic area.

## Remarks

The case studies are examined as so-called "portfolio exercise" and are therefore not a classic examination.

The theoretical knowledge acquired by the students is specifically applied in practice in the case study topics so that students analyse problems independently and apply proposed solutions. This intensifies the transfer of knowledge into practice and the targeted deepening of the acquired technical and methodological competences by recognising connections and evaluating them.

## MRO-12 Intelligent Multi-Agent Systems

Module code	MRO-12
Module coordination	Prof. Dr. Sebastian Grundstein
Course number and name	MRO-IR2106 Intelligent Multi-Agent Systems
Lecturer	Prof. Dr. Sebastian Grundstein
Semester	2
Duration of the module	1 semester
Module frequency	each semester
Course type	required course
Level	postgraduate
Semester periods per week (SWS)	4
ECTS	5
Workload	Time of attendance: 60 hours self-study: 90 hours Total: 150 hours
Type of Examination	Portfolio
Weighting of the grade	5 out of 90 ECTS
Language of Instruction	English

### Module Objective

The "Intelligent Multi-Agent Systems" course provides an in-depth exploration of the principles, algorithms, and applications of multi-agent systems. Multi-agent systems involve multiple agents or entities that interact to achieve a common goal. These systems have applications in various domains, including robotics, distributed computing, autonomous vehicles, and more. Students will learn about the design of intelligent agents, negotiation, cooperation, coordination, and decision-making in multi-agent environments. The course will cover both theoretical foundations and practical applications, enabling students to design and implement intelligent multi-agent systems.

Upon completion of this module, the student has achieved the following learning objectives:

#### Professional competence:

- Develop a deep understanding of multi-agent systems, their principles, and their applications.
- Gain skills in designing intelligent agents capable of autonomous decision-making and communication.
- Learn to design and implement communication and negotiation protocols for effective agent interactions.
- Understand the principles of cooperation and coordination among multiple agents, including task allocation and planning.
- Explore advanced topics such as coalition formation, game theory, swarm intelligence, and collective behavior in multi-agent systems.

**Methodological competence:**

- Develop skills in designing experiments and simulations to evaluate the performance of multi-agent systems.
- Acquire project management skills for developing multi-agent systems, including requirements analysis, design, and testing.
- Enhance problem-solving skills, particularly in diagnosing and addressing issues in multi-agent systems.
- Understand the importance of simulation and testing in the development and validation of multi-agent systems.

**Personal competence:**

- Foster critical thinking and analytical skills to evaluate and improve multi-agent systems.
- Cultivate innovation and creativity in designing intelligent multi-agent solutions and addressing complex challenges.
- Improve adaptability to keep pace with evolving technologies and methodologies in multi-agent systems.

**Social competence:**

- Improve the ability to communicate complex technical ideas to both technical and non-technical stakeholders.
- Build leadership skills and the capacity to mentor and guide peers in advanced robotics concepts and projects.
- Gain insights into the challenges and opportunities presented by global collaboration in the development and application of intelligent multi-agent systems .

## **Applicability in this and other Programs**

The module provides the necessary theoretical knowledge and transfer possibility for the application of multi-agent systems and algorithms in different systems and applications. Interfaces to mechatronics, electrical engineering and computer engineering.

## Entrance Requirements

Bachelor degree in mechatronics or a closely related field.

## Learning Content

This "Intelligent Multi-Agent Systems" course equips students with a solid foundation in multi-agent systems theory and practical development. By the end of the course, students will have the knowledge and skills to design, implement, and analyze intelligent multi-agent systems for various applications, making them valuable contributors in the fields of robotics, distributed computing, and more.

### Topics:

- Overview of multi-agent systems.
- Historical perspective and milestones in multi-agent systems .
- Intelligent Agents.
- Agent architectures and design principles .
- Autonomous agents, communication, and collaboration .
- Communication and Coordination.
- Autonomous agents, communication, and collaboration .
- Coordination mechanisms: centralized, decentralized, and distributed .
- Negotiation protocols and strategies .
- Cooperation and Collaboration.
- Multi-agent planning and task allocation .
- Multi-agent learning and knowledge sharing .
- Swarm intelligence and collective behavior .
- Simulation and testing of multi-agent systems .

## Teaching Methods

- Seminar-like teaching with joint exercises as well as presentations to deepen the knowledge achieved through application
- i-Learn (online learning platform)

## MRO-13 Soft Robotics

Module code	MRO-13
Module coordination	Christy Paul
Course number and name	MRO-AR2101 Soft Robotics
Lecturer	Christy Paul
Semester	2
Duration of the module	1 semester
Module frequency	each semester
Course type	required course
Level	postgraduate
Semester periods per week (SWS)	4
ECTS	5
Workload	Time of attendance: 60 hours self-study: 90 hours Total: 150 hours
Type of Examination	Portfolio
Weighting of the grade	5 out of 90 ECTS
Language of Instruction	English

### Module Objective

Soft Robotics is an emerging subfield of robotics with great potential for interfacing with delicate objects and living systems. Soft actuators are made of soft and compliant materials such as polymer/metal composites, elastomers, and hydrogels. These soft machines operate based on pneumatic, electrical, chemical, and optical actuation mechanisms. This course will focus on modeling, control, and manufacturing of electroactive polymer actuators and soft pneumatics actuators and their application in soft robotic systems.

#### Professional competence:

- XX

#### Methodological competence:

- XX

**Personal competence:**

- XX

**Social competence:**

- XX

**Entrance Requirements**

**Learning Content**

**Selected topics:**

- 1.Types of soft robots
- 2.Actuation mechanisms in soft robotics
- 3.Design and fabrication techniques
- 4.Bio-inspired designs and materials
- 5.Manufacturing soft robots
- 6.Control strategies for soft robotics

## MRO-14 Sensor Fusion and Perception for Assistive Robotics

Module code	MRO-14
Module coordination	Christy Paul
Course number and name	MRO-AR2102 Sensor Fusion and Perception for Assistive Robotics
Lecturer	Christy Paul
Semester	2
Duration of the module	1 semester
Module frequency	each semester
Course type	required course
Level	postgraduate
Semester periods per week (SWS)	4
ECTS	5
Workload	Time of attendance: 60 hours self-study: 90 hours Total: 150 hours
Type of Examination	written ex. 90 min.
Duration of Examination	90 min.
Weighting of the grade	5 out of 90 ECTS
Language of Instruction	English

### Module Objective

This course provides an in-depth understanding of sensor fusion and perception techniques tailored for assistive robotic applications. Students will explore how multiple sensor inputs can be integrated to enable robots to perceive and interpret complex, dynamic environments. Emphasis will be placed on practical applications, including navigation in human-centric spaces, obstacle avoidance, and understanding human activities and intentions.

#### Professional competence:

- XX

**Methodological competence:**

- XX

**Personal competence:**

- XX

**Social competence:**

- XX

## **Entrance Requirements**

## **Learning Content**

1. Probabilistic sensor fusion techniques
2. Multi-sensor calibration and synchronization
3. Data association and object recognition
4. Safety and redundancy in sensor fusion systems

## MRO-15 Biomechanics

Module code	MRO-15
Module coordination	Prof. Dr. Tim Weber
Course number and name	MRO-AR2103 Biomechanics
Lecturer	Prof. Dr. Tim Weber
Semester	2
Duration of the module	1 semester
Module frequency	each semester
Course type	required course
Level	postgraduate
Semester periods per week (SWS)	4
ECTS	5
Workload	Time of attendance: 60 hours self-study: 90 hours Total: 150 hours
Type of Examination	written ex. 90 min.
Duration of Examination	90 min.
Weighting of the grade	5 out of 90 ECTS
Language of Instruction	English

### Module Objective

This course explores the fundamental principles of biomechanics and their application in the design of assistive robotic systems. Students will learn how to analyze human movement and physical interactions to create robots that complement and enhance human capabilities, especially for individuals with mobility impairments or other physical disabilities. Emphasis will be placed on understanding human musculoskeletal mechanics, joint kinematics, and ergonomic considerations in human-robot interaction.

#### Professional competence:

- XX

#### Methodological competence:

- XX

**Personal competence:**

- XX

**Social competence:**

- XX

**Entrance Requirements**

**Learning Content**

1. Musculoskeletal system and joint mechanics
2. Kinematics & dynamics of human movement
3. Biomechanical Modeling and Simulation
4. Ergonomics and safety in assistive robotics design

## MRO-16 Rehabilitation Robotics

Module code	MRO-16
Module coordination	Prof. Dr. Dmitrii Dobriborsci
Course number and name	MRO-AR2104 Rehabilitation Robotics
Lecturer	Prof. Dr. Dmitrii Dobriborsci
Semester	2
Duration of the module	1 semester
Module frequency	each semester
Course type	required course
Level	postgraduate
Semester periods per week (SWS)	4
ECTS	5
Workload	Time of attendance: 60 hours self-study: 90 hours Total: 150 hours
Type of Examination	written ex. 90 min.
Duration of Examination	90 min.
Weighting of the grade	5 out of 90 ECTS
Language of Instruction	English

### Module Objective

This course explores the principles, technologies, and applications of robotics in rehabilitation. Students will learn how to design and implement robotic systems that assist individuals recovering from injury, surgery, or neurological conditions. The course covers topics such as exoskeletons, robotic prosthetics, and therapy devices, with a strong emphasis on human-centered design, adaptability, and effectiveness in aiding recovery. Students will gain hands-on experience in developing rehabilitation robotics solutions and evaluating their impact on patient outcomes.

#### Professional competence:

- XX

#### Methodological competence:

- XX

**Personal competence:**

- XX

**Social competence:**

- XX

## **Entrance Requirements**

## **Learning Content**

- 1.Types of rehabilitation robots and their applications
- 2.Design and application of robotic systems for rehabilitation therapy
- 3.Sensing and control systems in rehabilitation robotics
- 4.Adaptive and intelligent rehabilitation robotics
- 5.Service robots in healthcare institutions
- 6.Ethics and challenges in rehabilitation robotics

## MRO-17 Case Study Assistive Robotics for Improvement of Life Quality

Module code	MRO-17
Module coordination	Prof. Dr. Dmitrii Dobriborsci
Course number and name	MIR-AR2105 Case Study Assistive Robotics for Improvement of Life Quality
Lecturer	Prof. Dr. Dmitrii Dobriborsci
Semester	2
Duration of the module	1 semester
Module frequency	each semester
Course type	required course
Level	postgraduate
Semester periods per week (SWS)	4
ECTS	5
Workload	Time of attendance: 60 hours self-study: 90 hours Total: 150 hours
Type of Examination	Portfolio
Weighting of the grade	5 out of 90 ECTS
Language of Instruction	English

### Module Objective

A case study-based course on Quality of Life improvements with the help of Robotics focuses on understanding real-world applications of robotics through in-depth analysis of specific projects and use cases in various settings. The course uses case studies as the primary teaching method, allowing students to explore the challenges, solutions, and outcomes of various robotic systems in healthcare applications.

#### Professional competence:

- XX

#### Methodological competence:

## **Entrance Requirements**

## **Learning Content**

1. Wearable exoskeleton for muscle weakness support: lower-limb exoskeleton for individuals with muscle weakness
2. Home assistance for daily living: robots to assist with household tasks.
3. Rehabilitation and physical therapy support: devices for aiding physical recovery.
4. Mobility support for elderly or disabled Users: navigation aids, robotic wheelchairs, etc.
5. Sensory augmentation for visually or hearing-impaired individuals: wearables or devices enhancing sensory feedback.

## MRO-18 Human-Robot Interaction

Module code	MRO-18
Module coordination	Prof. Dr. Dmitrii Dobriborsci
Course number and name	MRO-AR2106 Human-Robot Interaction
Lecturer	Prof. Dr. Dmitrii Dobriborsci
Semester	2
Duration of the module	1 semester
Module frequency	each semester
Course type	required course
Level	postgraduate
Semester periods per week (SWS)	4
ECTS	5
Workload	Time of attendance: 60 hours self-study: 90 hours Total: 150 hours
Type of Examination	written ex. 90 min.
Duration of Examination	90 min.
Weighting of the grade	5 out of 90 ECTS
Language of Instruction	English

### Module Objective

This course examines the principles, techniques, and challenges of human-robot interaction (HRI) within the context of assistive robotics. Students will explore how robots can be designed to effectively interact with and assist people in daily tasks, particularly individuals with disabilities or special needs. Topics will include user-centered design, social and ethical aspects, communication interfaces, and real-time adaptive interactions. The course combines theoretical knowledge with hands-on experience, allowing students to prototype and evaluate interaction designs.

#### Professional competence:

- XX

#### Methodological competence:

- XX

**Personal competence:**

- XX

**Social competence:**

- XX

## **Entrance Requirements**

## **Learning Content**

1. User-centered design in assistive robotics
2. Communication modalities in HRI
3. Real-time adaptive interactions
4. Evaluation and Testing of HRI Systems

## MRO-19 Subject-Related Elective Course (FWP)

Module code	MRO-19
Module coordination	Prof. Dr. Dmitrii Dobriborsci
Course number and name	MRO3101 Subject-Related Elective Course (FWP)
Lecturer	Prof. Dr. Dmitrii Dobriborsci
Semester	3
Duration of the module	1 semester
Module frequency	annually
Course type	compulsory course
Level	postgraduate
Semester periods per week (SWS)	4
ECTS	5
Workload	Time of attendance: 60 hours self-study: 90 hours Total: 150 hours
Type of Examination	Examination form of the chosen module
Weighting of the grade	5 out of 90 ECTS
Language of Instruction	English

### Module Objective

Students can choose from a range of FWP subjects as part of the compulsory elective subject module.

Courses from a subject catalogue of related studies are offered at the DIT and, if applicable, the Virtual University of Bavaria (VHB), e.g.

- Computer Networking and Secure Network Management Interactive Online (CNSM)

Further courses deepen scientific topics in the field of artificial intelligence in production and logistics.

The offer is reviewed every semester and updated if necessary.

After completing the FWP module, the students have achieved the learning goals defined in the sub-module.

In the FWP module, the following competences are to be taught:

**Professional competence:**

The competences result from the chosen FWP subject.

**Methodological competence:**

The competences result from the chosen FWP subject.

**Personal competence:**

The competences result from the chosen FWP subject.

**Social competence:**

The competences result from the chosen FWP subject.

### **Applicability in this and other Programs**

All Master's programmes in which technical knowledge is required to solve complex problems.

### **Entrance Requirements**

Bachelor`s degree in mechatronics or a closely related field

### **Learning Content**

The contents result from the respective FWP subject.

### **Teaching Methods**

The didactic methods result from the respective FWP subject.

### **Remarks**

The FWP range of subjects includes courses with different ECTS values. Students are advised to take courses with at least 5 ECTS values.

The type of examination conducted for FWP courses is subject to the currently valid study regulations.

### **Recommended Literature**

The literature result from the respective FWP subject.

## MRO-20 Master Module

Module code	MRO-20
Module coordination	Prof. Dr. Dmitrii Dobriborsci
Course number and name	MRO3102 Master Thesis MRO3103 Master Colloquium
Lecturer	Prof. Dr. Dmitrii Dobriborsci
Semester	3
Duration of the module	1 semester
Module frequency	annually
Course type	required course
Level	postgraduate
Semester periods per week (SWS)	2
ECTS	5
Workload	Time of attendance: 30 hours self-study: 720 hours Total: 750 hours
Type of Examination	colloquium, master thesis
Weighting of the grade	25 out of 90 ECTS
Language of Instruction	English

### Module Objective

The master's programme "**Intelligent Robotics**" is concluded with a master thesis. Students are expected to prove that they can independently and successfully complete a certain task within a given period of time and that they can apply scientifically-founded theoretical and practical knowledge to solve a problem. After successful completion of the master thesis, students are able to work independently on complex scientific/technical tasks. They solve problems using digital methods as well as tools and find answers to current questions in the field of robotics.

The teaching content taught during the course of studies is applied in the form of a scientific paper. The problem is to be independently analysed, structured and processed within a given time frame. This trains the ability to independently work on technical

problems of a larger related topic and to process the results in scientific form. The aim is, among other things, to deepen and apply the ability to document the results transparently.

The Master's module consists of the Master's thesis (20 ECTS) and the Master's colloquium (5 ECTS). Both parts must be successfully completed. Additionally, participation in the seminar series "Career Start into German Technology Companies" is mandatory in order to obtain the 5 ECTS. The seminars/workshops are offered as block events during the first two semesters of study. The events cover a variety of topics that are of great importance for the preparation of the Masters thesis. In addition to scientific working methods, students are also introduced to application processes and the general conditions of the German labor market and its entry after graduation. After submitting the Masters thesis, the colloquium will take place. The Master's thesis is presented in a presentation of about 15 minutes and then defended (presentation and defense overall 45 minutes). The colloquium is assessed with 5 ECTS.

### **Professional competence**

Students are enabled to familiarise themselves with technical tasks, to analyse problems independently and to solve them.

After completing the module, students are able to work on a problem from the broad field of artificial intelligence for smart sensor and actuator technology in a scientifically sound manner.

### **Methodological competence**

The ability to independently work on and solve a comprehensive problem from the engineering sciences on a scientific basis is the overriding goal of methodological competence.

### **Personal competence**

Independent, autonomous and self-disciplinary scientific, methodical processing of a practice-relevant, delimitable (sub-)project in a study programme-related environment as well as written, independent documentation in the form of a scientific paper and require personal skills.

### **Social competence**

The students improve their social and interface competence through intensive communication with the supervisors at the Deggendorf Institute of Technology and in the cooperating industrial company.

## **Applicability in this and other Programs**

The Master's programme " **Intelligent Robotics** " enables students to work scientifically. The Master's degree entitles the holder to a subsequent doctorate.

## Entrance Requirements

The registration for the master thesis requires that at least 40 ECTS credits have been achieved (cf. study and examination regulations (SPO)).

## Learning Content

The topic of the master thesis will be set by a professor of the participating universities or by a cooperating company. In addition, the students are entitled to propose their own topics. A DIT professor is responsible for supervision and content support.

The master thesis includes:

- Presentation of the state-of-the art in science and technology of the topic being worked on
- Description of the methodology and the course of the own theoretical and experimental procedure including concept development
- Decision-making regarding the most favourable problem solution
- The integration of the own work into the work of the supervising institutes/faculties and possible industry partners.
- Report on own publications
- Report on the applications/possible applications for funding within the scope of the topic
- Creation of test setups and programs
- Execution of measurements and test runs including their evaluation
- Scientific documentation of the technical results achieved and their evaluation
- Study of literature

By writing a master thesis, students should demonstrate their ability to apply the knowledge and skills acquired during their studies to an independent scientific thesis. The master thesis is followed by a colloquium as an oral examination. The students present their master thesis and defend it.

## Teaching Methods

Guidance to independent work according to scientific methods by the respective supervisor.

Seminars, workshops, colloquium

## Remarks

The subject content of the master thesis can be chosen freely and individually by students. The topic must be recognised by the supervising professor. Furthermore, it is possible

to work on a topic in cooperation with a company and to work on a research topic at the faculty.

## Recommended Literature

Literature selected by the student for the specific subject area. Support for scientific work:

Eco, Umberto: How to write a scientific thesis; 13th edition; UTB Verlag; Vienna; 2010.

Scheld, Guido: Instructions for the preparation of internship, seminar and diploma theses as well as bachelor and master theses; 7th edition; Fachbibliothek Verlag; Büren; 2008.

Rossig, Wolfram; Prättsch, Joachim: Scientific works: Guidelines for term papers, bachelor's and master's theses, diploma and master's theses, dissertations; 7th edition; team printing; Weyhe; 2008.

Standop, Ewald; Meyer, Matthias: The form of scientific work; 18th edition; Quelle & Meyer; Wiebelsheim; 2008.
